Work Orders

The **ORDER POWER! Work Order** system supports the manufacturing of **Items** which you identify as "Manufactured" using the **Manufactured** field in Item Maintenance. This field is set to "M" for Make-to-Order, or "S" for Make-to-Stock.

You predefine **Bills of Materials**, **Work Centers**, and **Routings** from the *Work with Files menu*, and then create **Work Orders** from the *Work Orders menu*. **ORDER POWER!** will automatically create **Work Orders** for **Make-to-Order** items based on existing customer orders. For **Make-to-Stock Items**, you manually create **Work Orders** based on your expected demand.

Make-to-order vs. Make-to-Stock

A **Make-to-Order Item** is an item which is customized or normally not stocked, which you manufacture to the requirements of a customer's order. A **Make-to-Stock Item** is marketable to many customers, and probably made in advance of expected orders.

WIP Tracking

Component Items are moved from inventory into a **Work In Process (WIP) Location** in the production warehouse. Each WIP movement can be tracked by from-location, time, and the person who moved the items.

Integration With Inventory Warehouse Management

You issue components of **Manufactured Items** to specific **Work Orders** by transferring them from warehouse bins to a Work in Process location. The manufactured parent is subsequently moved back from Work in Process to any **Warehouse** location.

Comprehensive Reporting

A collection of reports and inquiries can be used to extract information quickly.

More about Work Orders

- Component substitutions are allowed.
- Component materials for **Manufactured Items** are identified with pick lists.
- Backflushing of all or some component materials can be done for shop orders on an order by order, component by component basis.
- The costs of materials used, plus optional standard overhead costs, are the factors used in calculating the cost of the manufactured Parent item.
- Shop orders are tracked using routings, operations and work centers.

Setting up **ORDER POWER!** for Work Orders

Here is a checklist of things you will need to set up to use **Work Orders**:

- Company Profile**see below
- Work Order support master files** see page 4
 - Work Order Work Centers** see page 5
 - Work Order Routing Codes** see page 7
 - Work Order Comment Codes (optional)**..... see page 10
- Set up GL for Work Orders**..... see page 15
 - Manufacturing Cost Types (optional)**..... see page 16
 - GL Manufacturing Classes (optional)** see page 17
- Items**..... see page 19
 - Item master set up** see page 19
 - Bill of Materials** see page 20
 - Warehouse Location**..... see page 23
 - Setting up Manufacturing Cost (optional)** see page 24

Company Profile options for Work Orders

The information you enter in the **Company Profile** customizes **ORDER POWER!** to meet your company's unique business requirements.

To set up Company Profile options for Work Orders

- From the **ORDER POWER! Main Menu**, select: **Work with Files → Company Profile → F15 (Maintenance) → Work Orders** to display *Company Profile Update Panel 19 (figure 1)*.

Company # 001	OP! 4.0 DEVELOPMENT ** CO# 001	Panel 19

Company Profile Update Panel 19 (figure 1)

2. Complete the following fields:

Next Work Order Number

Type a number to specify the next **Work Order** number you want **ORDER POWER!** to create. This will be automatically incremented every time a work order is created.

Update Sched Ship Date

Type **Y(es)** or **N(o)** to indicate whether or not you want the estimated completion date of **Make-to-Order Work Orders** to be used as the scheduled shipment date on associated customer orders. If you want, you can have the system add safety days to that scheduled shipment date using the **Add On Days to Complete** field on this panel.

Next Work Order Batch

Type the next **Work Order** batch number you want **ORDER POWER!** to create. Make-to-Order **Work Orders**, based on customer orders, are created in numbered batches. This will be automatically incremented every time a work order batch is created.

Account for Scrap

If **scrap** is typically produced in the manufacture of an item, you may factor that scrap into the item's **Bill of Materials** quantities, so that sufficient **Component Items** will be issued to complete the finished product. Upon completion of the Work Order, on the *Record Finished Goods Entry panel (figure 36)* you may designate that the excess material was scrapped, or that it is being returned to regular inventory. Scrapped or wasted material affects the cost of the manufactured parent item.

Type **I(nventory)** or **W(riteoff)** to indicate which option you want to use as a default when designating the disposition of excess material on *Record Finished Goods Entry panel (figure 36)*. This default may be overridden for any component in any work order.

Add On Days to Complete

If you have typed **Y(es)** in the **Update Sched Ship Date** field above, type the number of days you want to add to the **Work Order**'s estimated completion date when **ORDER POWER!** updates the scheduled shipment date on customer orders.

Make to order defaults to ship complete

Type **Y(es)** or **N(o)** to indicate whether or not you want **Order Entry** to default to **Ship Complete** on order lines where there is a **Make-to-order item** and quantity greater than one. This will prevent partial quantities from shipping before the work order is completed.

Issue components by

Type a code to indicate which field you want to be the cursor's default position on *Issue Components Select panel (figure 30)* for issuing components.

- 1 Batch Number

- 2 Work Order
- 3 Customer Order

Info Fields

These user-definable fields display on the panels indicated, and can be used to collect miscellaneous information about each **Work Order**. These **Info Fields** appear on the following panels:

Routing Header	<i>see Routing Code Update panel (figure 7)</i>
Work Order Transaction	<i>Future enhancement</i>
Routing Step	<i>Routing Step Update panel (figure 10)</i>
Work Center Master	<i>Future enhancement</i>
Bill Of Materials	<i>Future enhancement</i>

Mandatory

Type **Y**(es) or **N**(o) to indicate whether the user is required to fill the respective **Info Field** during data entry.

- 3. Press **Enter** to update the **Company Profile**.

Working with the Work Order support master files

The **Work Order** system relies on several files that you should set up in advance.

Work Centers *see page 5*

The manufacturing area can be divided into physical or logical **Work Centers** which can be used in the routing process. A routing defines a series of work centers in which the product is manufactured.

Work Order Routing Codes *see page 7*

A **Routing** code describes the manufacturing process. It can be created with an unlimited number of steps. Each step usually represents movement through a work center.

Work Order Comment Codes *see page 12*

A **Work Order Comment code** may be assigned to a line of notes related to a **Work Order** to specify whether or not you want the notes to print on **Work Orders** and/or **Work Order Pick Tickets**.

Manufacturing Cost Types *see page 16*

Up to 24 standard cost components, such as direct labor, indirect labor, fixed overhead, variable overhead, depreciation, allocated rent, etc. may be defined. Then for each manufactured item, the standard cost amount for each of these cost types may be specified. Those costs are added to the cost of the parent item as the work order is completed.

GL Manufacturing Classes *see page 16*

The 24 **Manufacturing Cost Types** (above) can each have a General Ledger expense account associated with them in a **GL Manufacturing Class**. An unlimited number of GL Manufacturing Classes can be created, which are then assigned to items or groups of items. This allows the same overhead

costs for different items to be booked to different GL accounts.

Working with Work Centers

The manufacturing area can be divided into physical or logical **Work Centers**. A **Work Center** can consist of a machine, a process, people, or combinations of the above. A Work center may be optionally identified as belonging to a GL department. This has no effect on accounting, it is for reference only.

To work with Work Centers

1. From the **ORDER POWER! Main Menu**, select: **Work with Files** **Ö** **Work Order Work Centers** **Ö** to display the *Work Center Inquiry panel* (figure 2).

```

2. Complete these fields:

Description

Type a description of the **Work Center** you are defining.

Vendor Number

If the work center is at a vendor’s site, you may enter the Vendor Number here. This is for reference only.

Department

Type a **GL Department** code that you relate to the **Work Center**. This is for reference only, and has no General Ledger effect

- 3. Press **Enter** to update the **Work Center**.

To display a Work Center

On the *Work Center Inquiry panel* (figure 2), type **5** (Display) beside the **Work Center** you want to see, then press **Enter** to display the *Work Center Display window* similar to *Work Order Document Update panel* (figure 53).

Working with Routing Codes

A **Routing** code is a user-defined code that describes the manufacturing process. It can be created with up to 999 **Routing** steps. Each step represents the **Work Center** where the work will be done. **ORDER POWER!** supports a default routing code for each manufactured item, as well as an unlimited number of alternate routings which may be assigned to any specific work order. Multiple items may share the same routing code.

To work with Routing Codes

- 1. From the **ORDER POWER! Main Menu**, select: **Work with Files** **Ö** **Work Order Routing Codes** **Ö** to display the *Routing Header Master Inquiry panel* (figure 5).

F1=Help F3=Exit F12=Cancel	

Routing Code Update panel (figure 7)

2. Complete these fields:

Description

Type a description of the **Routing** code you are defining.

Number of Calendar Days to complete

Type the number of days that you expect production of this product to last. This reflects *calendar* days, not work days. This information will be used to calculate an estimated completion date when a work order is released, based on the date it is released. Because these days are not sensitive to the quantity being manufactured, and do not consider shop capacity, you may need to change the estimated completion date of a released work order.

Info field 1 / Info field 2 / Info field 3

These user-definable fields can be used to collect miscellaneous information about each **Routing** code. Data entry into in these fields may be optional or mandatory depending on how you define the fields in the **Company Profile** (see page 2).

3. Press **Enter** to update the **Routing** code.

To display a Routing code

On the *Routing Header Master Inquiry panel (figure 5)*, type **5** (Display) beside the **Routing** code you want to see, then press **Enter** to display the *Routing Header Display window* similar to *Routing Code Update panel (figure 7)*.

To work with Routing Header Notes

Routing Header Notes are used to record any additional information you want to associate with this **Routing Header**, and optionally print on selected work order documents.

On the *Routing Header Master Inquiry panel (figure 5)*, type **7** (Notes) beside the **Routing Header** you want to see, to display the *Routing Header Notes panel* (not shown). See the “Working with Work Order Notes” section on page 62 for detailed instructions.

Working with Routing Steps

A **Routing Step** defines a single action in the manufacturing process, and identifies where (in which **Work Center**) it takes place.

To work with Routing Steps

1. On the **Routing Header Master Inquiry panel** (figure 5), type **6** (Routing Steps) to display the **Routing Master Detail Inquiry panel** (figure 8).

To display a Work Order Comment Code

On the *Work Order Comment Code Inquiry panel (figure 11)*, type **5** (Display) beside the **Work Order Comment Code** you want to see, then press **Enter** to display the *Work Order Comment Code Display window* similar to *Work Order Document Update panel (figure 53)*.

Setting up GL for Work Orders

General Ledger contra-inventory accounts must be established for the new Inventory Transaction Effect codes:

031	Transfer Component To/From WIP
032	WO Receipt - Finished Good
033	WO Component Used
034	WO Scrap

The General Ledger entries to the contra accounts for inventory transactions 031, 032, and 033 will always net to zero. For example, when a component is transferred to WIP, the following GL entries are made:

- Transaction 031 removes the component from its non-WIP location. The component's inventory account is credited, and the contra account for Transaction 031 is debited.
- Another Transaction 031 places the component into its WIP location. The component's inventory account is debited, and the contra account for Transaction 031 is credited.

When the above two transactions are posted to the General Ledger, the net effect is zero, to both the inventory and the contra accounts. However the contra account must be defined, and must be a valid GL account, for the entries to be made correctly.

When components are used in a manufactured item, the following GL entries are made:

- Transaction 033 removes the components from inventory. The components' inventory accounts are credited, and the contra account for Transaction Effect Code 033 is debited for the value of the components.
- Transaction 032 places the parent into inventory. The parent's inventory account is debited, and the contra account for Transaction Effect Code 032 is credited for the value of the components.

The contra account for 033 is debited with the same amount as the contra account for 032. When the above transactions are posted to the General Ledger, the net effect on the contra accounts is zero. However the contra account(s) must be defined, and must be valid, for the entries to be made correctly.

Dedicated "wash" accounts are recommended for use as the contra accounts for Transaction Effect codes 031, 032, and 033. The same GL account may be used as the contra account for all three transactions, or different accounts may be used, but the sum of the transactions to those three accounts will always net to zero. If those account(s) are dedicated to these **Work Order** transactions and are audited periodically, a non-zero net balance indicates an accounting error.

Transaction Effect Code 034 is used when you write off the expense of scrapped components. The component's inventory account is credited and the contra account is debited. A contra account must be assigned or no scrap entries will be made to the General Ledger.

Summary of GL Setup for Work Orders

If you are using the General Ledger, a contra account must be assigned to Transaction Effect codes 031, 032, 033 and 034. The identical account may be used as the contra account for Transaction Effect codes 031, 032 and 033. **ORDER POWER!** should maintain a zero balance in that account. A different account should be used for the 034 scrap transaction.

Working with Manufacturing Cost Types and GL Manufacturing Classes

The cost of materials components is only a part of the cost of a manufactured product. Other costs, such as Direct labor, Indirect labor, Temp labor, Fixed overhead, Variable overhead, depreciation, rent, etc. also contribute to the cost of the product and are supported as **standard costs**. These standard costs, plus the cost of materials, make up the total cost of manufacturing an item and are used in calculating the average inventory cost of such items.

You must set up **Manufacturing Cost Types** before **GL Manufacturing Classes**.

There are three tasks which define those standard costs:

- Define up to 24 company-wide **Manufacturing Cost Types**, such as Direct labor, Indirect labor, Temp labor, Fixed overhead, Variable overhead, depreciation, rent, etc.
- Create **Manufacturing GL Classes**, in which you assign a GL account to each of the cost types above.
- Assign a **Manufacturing GL Class** to an item, and define the per-unit overhead costs for that item by Cost Type.

To work with Manufacturing Cost Types

1. From the **ORDER POWER!** Main Menu, select:
Work with Files **Ö** **Manufacturing Cost Types** **Ö** **F15 (Maintenance)** to display the *Manufacturing Cost Type Maintenance panel (figure 14)*.

Manufacturing Cost Type Maintenance panel (figure 14)

- For each **Manufacturing Cost Type** you are defining, type a description of the costs you want the ability to accumulate in your **GL Manufacturing Classes**. These descriptions appear on *Work Order Document Update panel (figure 53)*.

To work with GL Manufacturing Classes

When overhead costs are applied to a manufactured item, the item's Inventory account is debited. The Overhead account in the item's GL Manufacturing Class is credited. A comparison of those credit amounts with the actual overhead expenses booked, will reveal variances of standard-to-actual overhead costs.

From the **ORDER POWER!** Main Menu, select: **Work with Files Ö GL Manufacturing Classes** to display the *GL Manufacturing Class Inquiry panel (figure 15)*.

Item Update panel (figure 18)

- Complete the **Item** setup as needed. The following fields are required for a **Manufactured Item**:

Stock

A Manufactured Item must be Stock **Y**(es).

Manufactured

Type a code to indicate if this **Manufactured Item** is:

- M** (Make-to-Order Item)
- S** (Make-to-Stock Item)

A **Make-to-Order Item** is an item which is customized or normally not inventoried, that you manufacture to the requirements of a single order.

A **Make-to-Stock Item** is marketable to many customers, and probably made in advance of expected orders.

To support legacy functionality, values of Y, N or blank will be accepted into this field. Those values indicate that the item is not a manufactured item.

Routing Code

Type the user-defined code that describes the manufacturing process you have defined for this **Item**. This is a default routing code which may be overridden for any work order.

For more information about working with **Items**, see the “**ORDER POWER!** Item Maintenance Users Guide.”

working with **items**, see the “**ORDER POWER!** Item Maintenance Users Guide.”

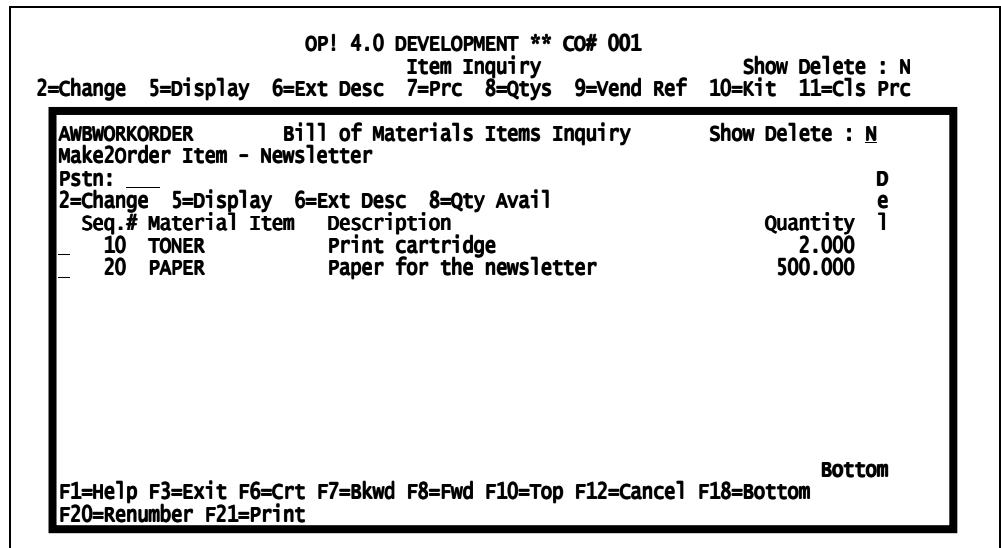

- When you have completed all the **Item** maintenance panels, press **Enter** to update the **Item** record.

Bill of Materials

For each manufactured **Item**, you must create a **Bill of Materials** (BOM) that defines all of the **Component items** necessary. You can create a single-level BOM for a finished **Item** or subassembly. A BOM can contain subassemblies which have their own BOM to create an unlimited number of levels. The BOM tracks all material costs, (including scrap) used in producing an **Item**.

To create a Bill of Materials

1. From the **ORDER POWER! Main Menu**, select: **Work with Files** → **Items** to display the *Item Selection panel*.
2. Type the name of the **Item** you want to work with in the **Item Code** field, then press **Enter** to display the *Item Inquiry panel*.
3. Type **10** (Kit) beside the **Manufactured Item** you want to work with to display *Bill of Materials Items Inquiry panel* (figure 19). When Option 10 is used with a Manufactured item, the Bill of Materials panels are displayed. When the same option is used with a Kit, the Kit Components panels are displayed.

Bill of Materials Items Inquiry panel (figure 19)

These actions are available, in addition to the standard **ORDER POWER!** functions:

Action	Description
2=Change	Display <i>Material Item Update panel</i> (figure 21) to work with an existing Materials Item

Material Item Update panel (figure 21)

2. Complete these fields:

Material Item

Type the **Item** number of the component you are adding to the **Bill of Materials**.

Override Description (optional)

Type an optional description that you want to associate with this **Material Item**, for purposes of this manufactured **Item**/Sequence number.

Routing Step

Type an optional **Routing Step** that you want to associate with this **Material Item**, for purposes of this manufactured **Item**/Sequence number.

Quantity

Type the quantity of this **Material Item** that you want to associate with this **Manufactured Item**, for purposes of this **Manufactured Item/Sequence Number**.

3. Press **Enter** to update the **Bill of Materials**.

To display a Materials Item

On the *Bill of Materials Items Inquiry panel (figure 19)*, type **5** (Display) beside the **Materials Item** you want to see, then press **Enter** to display the *Materials Item Display window* similar to *Work Order Document Update panel (figure 53)*.

To add a Warehouse Location for the Manufactured Item

This step is not necessary if a **Warehouse Location** already exists for the **Item**. Multiple locations may optionally be defined, and any location may be overridden during transaction entry.

1. From the **ORDER POWER! Main Menu**, select: **Work with Files** → **Items** to display the *Item Selection panel*.
2. Type the name of the **Item** you want to work with in the **Item Code** field, then press **Enter** to display the *Item Inquiry panel*.
3. Type **13** (QOH) beside the **Item** you want to work with, then press **Enter** to display the *Item Quantities On Hand window*.
4. Press **F6** (Create) to display the *Item Quantities On Hand Prompt panel (figure 22)*.

PEN Test item 1	OP! 4.0 DEVELOPMENT ** CO# 001 Item Quantities On Hand Prompt
?Warehouse ___ ?Location _____	
F1=Help F3=Exit F4=?List F12=Cancel	

Item Quantities On Hand Prompt panel (figure 22)

5. Complete these fields:

Warehouse

Type a user-defined code for the **Warehouse** where the **Manufactured Item** will be stored.

Location

Type a user-defined code for the **Location** within the **Warehouse** where the **Manufactured Item** will be stored.

6. Press **Enter** to display the *Item Quantities On Hand Update panel*.
7. Complete the fields on that panel as necessary (see the “ORDER POWER! Item Maintenance Users Guide” for more information about this panel), then press **Enter** to update the **Warehouse Location** record.

To set up manufacturing cost for an Item

This is an optional step. The manufactured cost of an **Item** is a user-definable standard cost for labor and overhead, plus the average inventory cost of its **Material Items**. Those costs adjust the **Parent Item**'s average cost and associated inventory GL account during receipt of the **Item** from a **Work Order**. The contra-inventory GL accounts for labor and overhead are user-definable.

1. From the **ORDER POWER! Main Menu**, select: **Work with Files** → **Items** to display the *Item Selection panel*.
2. Type the name of the **Item** you want to work with in the **Item Code** field, then press **Enter** to display the *Item Inquiry panel*.
3. Type **34** (Manufacturing/Kit-to-Stock Cost) beside the **Item** you want to work with, then press **Enter** to display the *Manufacturing Cost Inquiry panel (figure 23)*.

Creating Work Orders from Customer orders

Make-to-Order Items can be automatically transferred to production orders from customer orders. This batch program can automatically create one work order for every make-to-order line in customer orders. Optionally, those work orders can be created manually. When the work order is subsequently released to production, the Estimated Completion Date of the work order becomes the Scheduled Shipment date of the ordered item in the customer's order if the Company Profile says to do so. When it's finished, the manufactured item is committed to its customer order.

To create Work Orders from Customer orders

Use this option to generate **Work Orders** based on existing customer orders for **Make-to-Order Items**. (Use the "Create Manual Work Orders" option to create **Work Orders** for **Make-to-Stock Items**.) You cannot create **Work Orders** for orders that are on HOLD.

1. On the *ORDER POWER! Work Orders menu (figure 24)*, select **Create Work Orders from Customer Orders** to display *Work Orders Creation panel (figure 25)*.

```

                                OP! 4.0 DEVELOPMENT ** CO# 001
                                Work Orders Creation

Save Changes ..... N          Y/N

F1=Help F3=Exit F4=?List F12=Cancel

```

Work Orders Creation panel (figure 25)

2. Complete these fields to select **Customer Orders** for which you want to create **Work Orders**:

Thru Requested Date

Type a date **Work Orders** will be created for **Make-to-Order** items in customer orders, where the Requested Shipment Date of the ordered item is earlier than or equal to the date entered here.

Warehouse

Type a user-defined code that indicates which **Warehouse** you want to create **Work Orders** for.

Item Number

Type a code to indicate if you want to:

- 1 Create **Work Orders** for all **Make-to-Order Items** that have been ordered by customers
- 2 Create **Work Orders** for specific **Make-to-Order Items** that have been ordered by customers

Order Number

Type a code to indicate if you want to create **Work Orders** for:

- 1 All customer orders.
- 2 Specific customer orders.
- 3 A range of customer orders.

Use Current Printer Defaults

Type **Y**(es) or **N**(o) to indicate whether or not you want to change the existing printer defaults for the current report.

Submit to Batch

Type a code to indicate whether the report should be submitted to a job queue to process behind the scenes in batch mode and immediately free up your terminal, or run the report interactively which locks the terminal until the program has completed.

- Y** (es) indicates that the report will be submitted as a batch job
N (o) indicates that the report will be run interactively

Save Changes

Type **Y**(es) or **N**(o) to indicate whether or not you want any changes made to the defaults for the current panel to be applied to all subsequent displays of that panel. This eliminates redundant data entry.

3. Press **Enter** to create **Work Orders**.

Creating Manual Work Orders

Use this option to generate **Work Orders** on demand for **Make-to-Stock Items**. It may optionally be used for **Make-to-Order Items** on specific sales order/lines.

If you choose to create manual work orders for **Make-to-Order** customer orders, Order Power! will not prevent you from creating and releasing more than one manual work order for a single Make-to-Order customer order and line, nor will it prevent you from creating and releasing manual work orders whose quantities, individually or in total, exceed those ordered by the customer. The customer order's Audit will show every work order created, however the ordered line will only show the most recent work order created. As those multiple work orders are completed, they will each be committed to the customer order, up to the quantity ordered by the customer. Any excess quantities completed will be placed, uncommitted, into inventory.

To create Manual Work Orders:

1. On the *ORDER POWER! Work Orders* menu (figure 24), select **Create Manual Work Orders** to display *Create Manual Work Order Prompt* panel (figure 26).

F1=Help F3=Exit F4=?List F12=Cancel	

Create Manual Work Order Update panel (figure 27)

- Complete these fields:

Whse

Type the user-defined code that indicates the production **Warehouse** for this manufactured **Item**.

Quantity Ordered

Type the quantity of the **Item** that you intend to produce.

Routing Code (optional override description)

Type an alternative description of the **Routing Code** that you have used for this **Work Order**.

Est Completion Date (optional)

Type the estimated completion date of the Work Order. If left blank, when the Work Order is released to production this date will be calculated using the field below, “Days to Complete”. Also when a Make-to-Order Work Order is released, this date plus “Add on days to complete” in the Company Profile may become the Scheduled Release Date of the manufactured item in the Customer Order.

Days to Complete (optional)

Type the number of days that you expect production of this **Item** to last. This reflects *calendar* days, not work days.

- Press **Enter** to update the **Work Order**.

Release Work Orders

You must release **Work Orders** before you can begin work. This process creates demand on the components of the **Manufactured Item**’s **Bill of Materials** in their “Qty On Cust Order” and “Qty On WO” totals. When Make-to-Order work orders are released, the associated customer orders’ Scheduled Shipment Date may be optionally be changed by the system.

To release Work Orders

1. On the *ORDER POWER! Work Orders* menu (figure 24), select **Release Work Orders** to display *Work Order Release* panel (figure 28).

```
OP! 4.0 DEVELOPMENT ** CO# 001

Work Order Release panel (figure 28)

2. Complete these fields:

Release Date

Type the date on which you expect to release this Work Order to the shop floor. Future dates are acceptable. For Make-to-Order work orders, this date is the starting basis for calculating the customer order's Scheduled Shipment date.

Warehouse

Type a user-defined code that indicates for which **Warehouse** you want to release **Work Orders**.

Work Order Number

Type a code to indicate if you want to:

- 1 Release all **Work Orders** for the specified **Warehouse**
- 2 Release selected **Work Orders** for the specified **Warehouse**
- 3 Release a range **Work Order** numbers for the specified **Warehouse**

Batch

Type a code to indicate if you want to:

- 1 Release all **Work Orders** for the specified **Warehouse**
- 2 Release selected batches of **Work Orders** for the specified **Warehouse**
- 3 Release a range of **Work Order** batches for the specified **Warehouse**

Use Current Printer Defaults

Type **Y**(es) or **N**(o) to indicate whether or not you want to change the existing printer defaults for the current report.

Submit to Batch

Type a code to indicate whether the report should be submitted to a job queue to process behind the scenes in batch mode and immediately free up your terminal, or run the report interactively which locks the terminal until the program has completed.

- Y** (es) indicates that the report will be submitted as a batch job
N (o) indicates that the report will be run interactively

Save Changes

Type **Y**(es) or **N**(o) to indicate whether or not you want any changes made to the defaults for the current report to be applied to all subsequent displays of this panel. This eliminates redundant data entry.

3. Press **Enter** to release **Work Orders**.

Issue Components

Items can be issued into your Warehouse's **Work In Process** location based on all the components required, or you can issue partial quantities throughout large production runs.

To issue components

This optional step issues quantities of the components on the **Manufactured Item's Bill of Materials**. Components will only be issued for **Items** on **Work Orders** that you have released. Using this option allows you to move components from available inventory into a logical **Work in Process** location so that they are not available for order picking.

1. On the *ORDER POWER! Work Orders menu (figure 24)*, select **Issue Components** to display *Issue Components Select panel (figure 29)*.

The **Batch Number** can be found on the "Work Orders Created Listing" that **ORDER POWER!** produces when you run the **Create Work Orders from Customer Orders** option. It can also be seen in each customer order's Audit history.

```

Issue Method ..... 1 1=Enter Details 2=Prefill As Expected
3=Issue As Expected

F1=Help F3=Exit/No Post F4=?List F15=Exit/Post

```

Issue Components Select panel (figure 30)

4. Complete these fields to select **Work Orders** for which you want to issue components:

Batch Number

Type the **Batch Number** that can be found on the “Work Orders Created Listing” that **ORDER POWER!** produces when you run the **Create Work Orders from Customer Orders** option, or in the customer order’s Audit display.

-or-

From Work Order / To Work Order

Type a range of **Work Orders** numbers.

-or-

From Customer Order / To Customer Order

Type a range of **Customer** order numbers.

5. Complete this field:

Issue Method

Type a code to indicate if you want to:

1= Enter Details - Enter quantities to issue for each component on each Work Order

2= Prefill As Expected – Pre-fills the quantity to be issued with the quantity required by the Bill of Materials, limited to what is available to be issued from inventory, then displays the pre-filled amounts so they can be viewed and changed.

3= Issue As Expected – Issue the total quantity required by the Bill of Materials, limited to what is available to be issued from inventory.

6. Press **Enter**.

- If you typed **1** (Enter Details) or **2** (Prefill As Expected) in the **Issue Method** field, **ORDER POWER!** displays *Issue Components Detail panel (figure 31)*. For option **2** (Prefill As Expected), the components’ from-locations will also be pre-filled based on the same logic that Customer Order Release uses for picking.
- If you typed **3** (Issue As Expected) in the **Issue Method** field, **ORDER POWER!** issues the total quantity required, if it is available, then redisplay the *Issue Components Select panel (figure 30)*. The quantities may still be displayed or changed by selecting **1** (Enter Details) for the work order. Press **F15** (Exit/Post) to issue the components.

Issue Components Item Detail window (figure 32)

- Complete these fields:

Issue Qty

Type the quantity of the **Materials Item** you want to issue to this **Work Order**.

Location

Type the location from which you want these **Items** to be picked. If left blank, picking logic will be used to automatically determine the location(s) from which the component should be picked.

- Press **Enter** to issue the **Materials Item** to this **Work Order**.
- Press **F15** (Exit/Post) to issue the components. This will create and post a batch of inventory transactions, using **Inventory Effect Code 031** "Issue To/From WIP" to transfer the components from their designated locations to the WIP location. A pick ticket will print which can be used to physically pick the components.

Enter Progress of Work Order

Use this optional step to record the progress of a **Work Order** through its routing steps, so that information is available to other **ORDER POWER!** users.

To enter progress of a Work Order

- On the **ORDER POWER! Work Orders menu** (figure 24), select **Enter Progress of Work Order** to display the **Progress of Work Order Prompt panel** (figure 33).

```

OP! 4.0 DEVELOPMENT ** CO# 001
Progress of Work Order Prompt

F1=Help F3=Exit F12=Cancel

```

Progress of Work Order Entry panel (figure 34)

4. Complete these fields:

Quantity

Type the quantity of the Manufactured item which has completed this routing step. If an error is made, quantities may be reversed by entering a minus sign after the quantity (for example, 10-).

Hours Used (optional)

Type the number of hours used in completing this step.

Cost

Type the cost of completing this step. You can use this field to capture miscellaneous manufacturing costs and subcontracting costs incurred in the manufacturing process. These costs are not used for accounting in the General Ledger.

Step Completed

Type **Y**(es) or **N**(o) to indicate if this step is complete. A previously completed routing step will default to **Y**, but the step may be re-opened with an **N**.

5. Press **Enter** to update the step.

Recording Finished Goods

Use this option to transfer finished **Items** to their eventual inventory locations.

Component Items which are not used can be transferred back to inventory, or they can be scrapped.

To record finished goods

This step is required to create the appropriate inventory transactions when items have been completed in a **Work Order**. You can also close the **Work Order** using this option.

1. On the *ORDER POWER! Work Orders menu (figure 24)*, select **Record Finished Goods** to display *Record Finished Goods Prompt panel (figure 35)*.

OP! 4.0 DEVELOPMENT ** CO# 001 Record Finished Goods Prompt

6. Complete these fields to update the disposition of **Material Items**:

Used

Type the quantity of the **Material Item** that was used in creating the finished **Manufactured Items**. These will be removed from the WIP inventory location with **Inventory Effect Code 033** “WO Component Used.”

Scrap

Type the quantity of the **Material Item** that was wasted or broken in production, and should be subtracted from Inventory. These will be removed from the WIP inventory location with **Inventory Effect Code 034** “WO Scrap.”

Return

Type the quantity of the **Material Item** that was unused in production, and should be returned to Inventory. These will be moved from the WIP inventory location back into available inventory with **Inventory Effect Code 031** “Transfer Component to/from WIP”.

Location

Type the inventory location to which you want the unused component returned.

Backflush

Type the quantity of the **Material Item** that was used, but not previously moved from Inventory to WIP with the “Issue Components” menu option. This will issue the remaining required components from inventory.

Location

Type the inventory location from which you want the component backflushed.

7. Press **Enter** to display to process the next **Work Order**. If this is the last one you are working with, the *Record Finished Goods Entry panel (figure 36)* will be displayed. From there, press **F15** (Exit/Post) to display the *Finished Goods Posting Confirmation window (figure 39)*.

Submit to Batch N Y/N
F1=Help F3=Exit/No Post F12=Cancel

Finished Goods Posting Confirmation window (figure 39)

8. Complete these fields:

Posting Date

Type the date you want to appear to these transactions.

Submit to Batch

Type a code to indicate whether the posting should be submitted to a job queue to process behind the scenes in batch mode and immediately free up your terminal, or complete the posting interactively which locks the terminal until the posting has completed.

- Y (es) indicates that the report will be submitted as a batch job
- N (o) indicates that the report will be run interactively

Save Changes

Type Y(es) or N(o) to indicate whether or not you want any changes made to the display for the current panel to be applied to all subsequent displays of the panel. This eliminates redundant data entry.

9. Press **Enter** to post the transactions. This will move the finished goods into available inventory, using **Inventory Effect Code 032** “WO Receipt - Finished Good”. If the work order was make-to-order, the finished product is also committed to the associated customer order.

Deleting a Work Order

Use this option to delete a Work Order. You cannot delete a Work Order if you have already issued **Material Items** or completed some or all of the **Manufactured Items**. In that case the Work Order must be **closed** with the **Record Finished Goods** option (even if no finished goods were produced) instead of being deleted.

1. On the *ORDER POWER! Work Orders* menu (figure 24), select **Delete Work Order** to display the *Delete Work Order Prompt* panel (figure 40).

Type an alternative description of this **Routing Step**.

Work Center

Type the **Work Center** for this **Routing Step**.

Vendor #

Type code assigned to a supplier of goods and/or services who is performing this step. This is for reference only.

PO #

Type the **Purchase Order** number used for the **Vendor** you entered above. This is for reference only.

Quantity Ordered

Type the quantity of the **Manufactured Item** that you want to produce in this **Routing Step**.

Estimated Completion Date

Type the estimated completion date of this **Routing Step**.

Actual Completion Date

Type the actual completion date of this **Routing Step**, when it occurs. This is normally done with Menu option #5 “Enter progress of Work Order”, which allows more information to be captured.

3. Press **Enter** to update the **Routing Step**.

To display a Work Order’s Routing Steps

On the *Work Order Routing Steps Inquiry window* (figure 44), type **5** (Display) beside the **Routing Step** you want to see, then press **Enter** to display the *Routing Step Display window* similar to *Routing Step Update panel* (figure 46).

To work with a Work Order’s Routing Step notes

Use this option to record any additional information you want to associate with this **Routing Step** for the selected **Work Order** only.

On the *Work Order Routing Steps Inquiry window* (figure 44), type **7** (Notes) beside the **Routing Step** you want to see, and the Routing notes are displayed. See the “Working with Work Order Notes” section on page 62 for detailed instructions.

To work with a Work Order’s Bill of Materials

Use this option to modify a **Manufactured Item’s Bill of Materials** for the selected **Work Order** only.

1. On the *Work Order Inquiry* panel (figure 42), type 7 (Components), beside the **Work Order** you want to work with, then press **Enter** to display the *Work Order Bill of Materials Item Inquiry* window (figure 47).

The **Available to Make** initially displays the maximum quantity which could be made with the currently available quantity of **Component Items**. You can change the quantity in this field, then press **Enter** to calculate quantities of **Component Items** that would be needed.

Working with Work Order Notes

Work Order Notes are used to record any additional information you want to associate with a **Work Order**, **Routing code**, **Routing Step** or **Bill of Materials**.

Notes which are attached to the **Routing Codes** and **Routing Steps** in the routing master file are copied at **Work Order** creation to the **Work Orders** which use that **Routing Code**. This is true of **Routing** notes only. These notes are commonly used for instructions to the shop floor.

The following example describes a procedure for working with **Routing Code Notes**, but also applies to other **Work Order Notes**.

To work with Routing code Notes

1. On the *Routing Header Master Inquiry panel (figure 5)*, type **7** (Notes) to display *Routing Header Notes window (figure 63)*.

```
